

Hello there...
Welcome
aboard!

ABOUT US

This is a **patient centered information exchange system**.

Our idea is to develop a patient-centered information exchange system which provides a systematic storage for patient medical information, which is easily accessible to patients and doctors. This application has three users namely, **Patients, Doctors/Experts and Hospital Administration**. Patients can view their medical records while doctors can view and update/modify the patient's medical records. Doctors who also work as experts can chat with the patients and provide necessary services/suggestions considering the symptoms mentioned by the patients.

This web application gives an option to the patients to upload/update their basic test results such as BP, Sugar level, Pulse rate, Oxygen Saturation level, etc. Patients can also chat with experts for consultations in the provided chatroom. The hospital administration can view , access and update patient records by adding/removing reports on latest developments in patient's health as suggested by the doctor. The progress in health of the patients will be represented in the form of graphs.
